

THE MIDNIGHT MISSION

A haunted toy room. An interactive graphics story.

ROOM NIGHT

EXPLORE, CONTROL, COMPARE

The proposal is realised as an eight-stage story from night to morning.

Play as Penny or any toy; the story layer drives the rest

TRS + hierarchy; chest lid, mounting, Bullseye jump

Three light types; Gouraud and Phong

27 surface maps; analytic BVH ray tracing

PLAY PROJECT DEMO

HOUSE

TOYS ALIVE

PRIMITIVES BECOME CHARACTERS

Position, normal and UV data define five indexed mesh families.

Plane 4 vertices / 2 triangles; cube 24 / 12

Sphere: $24 \times 36 \rightarrow 925$ vertices / 1656 triangles

Cylinder: 134 / 128; cone: 99 / 64

The scene uses shared buffers and instance transforms

WOODY

BUZZ

PENNY

A WORLD WITH SURFACE DETAIL

The house, garden, room and furniture belong to one connected scene.

Wood grain, wallpaper, cloth, moon craters and book rows

UV repeats multiply material colour by sampled RGB

Picket alpha cuts holes and replaces repeated geometry

27 maps plus white in one texture array serves the ray tracer

HOUSE

WINDOW

BOOKCASE

ONE PARENT MOVES THE RIDER

$$M_{\text{world}}(\text{child}) = M_{\text{world}}(\text{parent}) \times M_{\text{local}}(\text{child})$$

R: mount/dismount within 2.2 units

1-5 + W/S/A/D: choose and drive a toy

Select: live takeover; 0 release; N full manual

F: inspect; C: Free / Orbit / Follow

Normal matrix = inverse transpose of world linear part

LIVE CONTROL

MOUNTED

EVERY MOTION HAS A RULE

Delta time connects displacement, gait, wheel rotation and camera motion.

Gait angle = $\sin(\text{distance phase}) \times \text{amplitude}$

Wheel angle = $\text{distance} / \text{radius}$

Hinges: chest lid, doors, wardrobe; jump
= $0.75 \sin(\pi t)$

Followers route through 13 doorway
nodes

Sunrise: 23:36 → 07:00 in 16 s; fog thins

RESCUE JUMP

BUZZ FLIGHT

DOOR IMPACT

THREE LIGHT TYPES

Ambient + diffuse + specular + emission

Directional: sun/moon; parallel rays

Point: lamp bulb; $1/(k_c + k_l d + k_q d^2)$

Spot: lamp/headlights; smooth inner/outer cone

Diffuse = $k_d \max(N \cdot L, 0)$

Specular = $k_s \max(R \cdot V, 0)^n$

LAMP

SPOT

DIFFUSE

WHERE IS LIGHT EVALUATED?

Matched views expose the difference between vertex and pixel illumination.

Flat: triangle normal from position derivatives

Gouraud: vertex lighting → interpolated colour

Phong: interpolated normal → pixel lighting

Blinn: half-vector $H = \text{normalize}(L+V)$

F2 cycles raster modes; F4 returns to ray tracing

FLAT

GOURAUD

PHONG

BLINN

RAYS REVEAL A SECOND VIEW

Primary ray → nearest analytic hit → illumination → bounded continuation

BVH median split; world-space boxes;
near child first

Five analytic primitive intersection
equations

Shadow rays test visibility to selected
lights

Mirror floor/ball; straight transparency

Raster lamp: 2048^2 depth map + 3×3
PCF

RAY ZERO

ROOM RAY

10 THE TOYS ARE SAFE

THANK YOU

All five escape into the morning. The world stays open.
